

Weigh Belt Feeders for the Cement Industry

Web Tech AutoWeigh have been supplying weigh belt feeders to the cement industry for over 25 years. Handling products such as clinker, cement, gypsum and limestone, we have a range of standard models suitable for nearly any application. We have also modified the standard designs to suit existing plant requirements, or to replace existing old equipment. Due to the operating environment, weigh belt feeders for the cement industry need to be heavy duty designs with robust construction.

We can offer open, partially enclosed or fully enclosed type constructions, fabricated from mild steel powder coated or stainless steel. Options such as scavenger scrapers in the bottom of the enclosure to remove dust build-up, and dust extraction outlets are available. As well as the mechanical aspects of the weigh belt feeders, Web Tech AutoWeigh design and manufacture its own range of electronic integrators and controllers. As well as providing standard information such as rate and total, additional options such as serial communication boards, calibration audit trails and control outputs are available. Special applications requiring high turn-down ratios can be provided with servo drive motors and the associated controllers.
